Task 3

This was really hard for me. I tried multiple times but the dam kept tearing, especially around the clamp once its attached to patients tooth. I think the challenge of this task is that it is an isolation from 36 to 44, and no longer a single tooth isolation.

When I flossed to get the dam between the anterior teeth, the dam tore because of the incorrect pressure and position of my floss. My dam also tore when I tried to flick the dam away to expose the covered wings. But clamp bow is finally correctly positioned towards the distal of 36.

Evaluation for DDI-DDS: Dental Dam Isolation (DDS)

Marking Checklist	Student	Educator	Critical
Nasal airway open and oral cavity covered	Yes		Yes
Chosen clamp fits securely around tooth	Yes		No
Clamp correctly secured with floss, floss is secured and contained	Yes		Yes
Clamp handling: wings and beaks exposed, no floss caught in beaks	NA		Yes
Accessory retention appropriately placed (if applicable)	NA		Yes
Dam secured to frame, frame correctly oriented	NA		Yes
Appropriate number of teeth isolated	NA		Yes
Dam flossed interproximally, including distal to the clamp	NA		No
Dam inverted around all teeth	NA		No
No large tears	No		Yes

Dental Dam Isolation (DDS) Score: (Cutoff: 0.81)

Task 1

This task took a large portion of my time at the lab and I was behind compared to my peers. It was because I didn't manage to orientate the clamp properly once it was through the 36 hole in the dam.

Assessor Feedback

Watch you dont go overtime with the task at hand. Good effort.

Task 2

This task went relatively smoothly, with just a repeat of 36 isolation on the manikin. However, I do need to practice more on my finger rests as my unfamiliarity with forceps and flossing for the patient makes me lose my pen grip and finger rests. A small tear was present on the wing on the clamp, but it was quite insignificant. Nice distal and mesial isolation of the tooth by stretching the dam towards the frame.

FS

I was quite happy with my fissure sealant application on 37. It was smooth, right on the fissures including buccal fissure, and there was no excess. This was complimented on by the demonstrator!

SmOcc Prep

I was not so happy with this one, because I did not manage to hold the bur parallel to the cusps, the margins of my cavity prep was much larger than expected. The incorrect angulation of my bur also created unsupported enamel towards the lingual aspect of 36, which means I had to widen the enamel margin even more. The demonstrator also mentioned that I went too deep into the dentine with the slow-speed handpiece. The enamel margins I've created have also been irregular, especially towards the buccal aspect. Along with rough dentine surface, the demonstrator could tell that I didn't keep both my burs moving while cutting. Instead, I held the bur at the same spot and lifted it to go to another black caries spot I saw. I also have not used my high speed bur to the full extent because there is a small section in the buccal aspect where there is an uneven vertical bump on the cavity prep wall.

SmOcc Resto

I didn't have enough time to get to complete restoration, but I have applied the primer and bonding agent on cavity prep of 37. This shall to continued and attended to next session, which is happening next week.

Assessor Feedback

Keep high and slow speed burs moving to create smooth outline and internal surfaces

When smoothing occlusal outline, insert high sod bur to full thickness of enamel to avoid creating a step in the enamel outline

Assessor Feedback

Floss caught in beak of clamp. 2 large tears.
Restoration was rough before polishing, think about sequence of placing sealant and bonding to enamel, revise finishing and polishing burs.
Excessive fissure sealant likely to affect occlusion.
